

TURCK's FDN20-4S-4XSG is a low-cost DeviceNet station or node. These stations allow you to easily connect the Auxiliary Status Outputs of the SC22-3 Safety Controller to a DeviceNet network for the purpose of monitoring the safety system.

The SC22-3 Safety Controller provides up to ten Auxiliary Status Outputs that can be individually configured to provide safety system information. Status outputs can track input and output status, mute status, lockout, fault conditions, whether a reset needed, and more.

The FDN20 station is designed to easily upgrade new or existing equipment to a DeviceNet network. Additional stations include the FDN20-16XSG with up to 16 inputs and the FDN20-32SN with 32 inputs.
