

Safety Inputs      Safety Inputs

TURCK's FDP20-16S and -16XSG are a low-cost PROFIBUS-DP stations (or nodes). These stations allow you to easily connect the Auxiliary (non-safety) Status Outputs of the SC22-3 Safety Controller to a PROFIBUS-DP network for the purpose of monitoring the safety system.

The SC22-3 Safety Controller provides up to ten Auxiliary Status Outputs that can be individually configured to provide safety system information. Status outputs can track input and output status, mute status, lockout, fault conditions, whether a reset needed, and more.

The FDP20 station is designed to easily upgrade new or existing equipment to a PROFIBUS-DP network.
